

LI-FT® SALINE PIGMENT REMOVAL

Client Information & Aftercare Guide

La pmua Niagara is proud to offer LI-FT®—an advanced, all-natural saline pigment lightening solution designed to safely and effectively remove or lighten unwanted permanent makeup and small body tattoos.

The LI-FT® Difference

Unlike traditional laser removal, which uses heat to break down ink particles, LI-FT® utilizes the power of osmosis. A specialized, hypertonic saline solution is gently implanted into the targeted area, drawing the pigment up and out of the skin.

- **Universal Efficacy:** Works safely and effectively on **all pigment colours**, including those that lasers often leave behind (like titanium dioxide and yellows).
- **Skin-Safe:** A non-laser, non-acid formula containing sterile water, pure sea salt, and soothing fruit seed extracts to lift pigment naturally without excessive trauma or burning.
- **Versatile:** Perfect for correcting discolored brows, migrated eyeliner, or lip blushing.

Treatment Plan & Investment

Achieving your desired results is a process that requires patience and proper skin healing. Every removal journey is unique.

- **Expected Timeline:** Most clients require **1 to 3 sessions** to achieve their desired level of lightening or complete removal.
- **Healing Window:** Sessions must be strictly spaced **6 to 8 weeks apart** to maintain the integrity of your skin and allow the healing cycle to complete.

Your Investment:

- **Single Session:** \$200
- **Package of 3:** \$550 (*Recommended for optimal lifting*)

Clinical Aftercare Protocol

Your results depend heavily on how well you care for the treated area. Please adhere to these instructions strictly to prevent scarring and ensure maximum pigment extraction.

1. The Drying Phase (First 48 Hours)

- **Keep it Dry:** Do not touch, wash, or wet the area. Air drying is essential for the skin to form a proper, protective scab that will hold the pulled pigment.
- **No Products:** Do not apply any ointments, creams, makeup, or ice.

2. The Scabbing Phase (Days 3–14)

- **Keep it Clean:** Avoid direct shower spray on the face. If the area gets slightly wet, gently pat it completely dry with a clean paper towel. Do not soak in baths, pools, hot tubs, or saunas.

- **No Sweating:** Avoid intense exercise until the scab falls off naturally. Sweat can loosen the scab prematurely and cause stinging.
- **DO NOT PICK:** This is the most critical rule. Let the scab fall off completely on its own. Forcing or picking the scab off will disrupt the lifting process and can lead to scarring or hyperpigmentation.

3. The Healing Phase (Post-Scab)

- **Nourish:** Only *after* all scabbing has naturally fallen off, apply a drop of Vitamin E oil or your recommended post-care balm 1–2 times daily to support skin recovery.
- **Protect:** Avoid direct sun exposure, chemical peels, and active skincare ingredients (retinols, acids) on the area for at least 4 weeks.

What to Expect

You may experience mild redness, tenderness, or swelling immediately following your treatment. Once the scab forms, you might visibly see pigment trapped inside it—this is a sign the treatment is working!

The treated area may temporarily appear cloudy, red, or patchy as your fresh skin heals over the old pigment. True lightening results are evaluated at the full 8-week mark.
